DINA 2026 update
Country comparisons and changes

26 exported countries: 11 calculated directly, 15 donor-imputed
Pretax national income | Equal-split adults

Review export completed through 07d on 23 October. All 686 distributions passed grid, share and export checks. The published 22 October files are preserved. This is not yet a complete delivery: four donor-recipient refreshes and the COL/ECU national-accounts handoff remain outstanding.

How to read the comparisons

The plots show three complete series: the November 2025 delivery, the 22 October 2026 export before the latest Peru review, and the latest export. Overlapping lines mean that this final review did not materially change that country. They do not establish that it is unchanged relative to 2025.

Changes in shares are percentage points, not percent changes. New observations, interpolation and carry-forward years are distinguished in the captions. Source coverage is not the same as the final export horizon.

Main findings

- ARG: the 2000-2014 extrapolation policy is unchanged. Donors for that correction are Argentinian Admin-survey matches. Survey revisions are verified; a complete historical causal allocation remains unavailable.

- CRI: accepted tail-processing corrections preserve income anchors instead of clipping bracket incomes. The backward series inherits the revised 2010 distribution.

- PER: restored donors and the newly consumed annual accounts bring the 2019 top-10 share to 56.44% (2025 delivery: 56.41%) and 2020 to 66.26% (65.65%). The 2015/2021 surveys are now calculated directly for review.

- ECU: the approved supplied distribution covers 1990-2022, followed by the broad-group continuation and normal WID scaling. Its internal continuation is still affected by the outstanding national-accounts handoff.

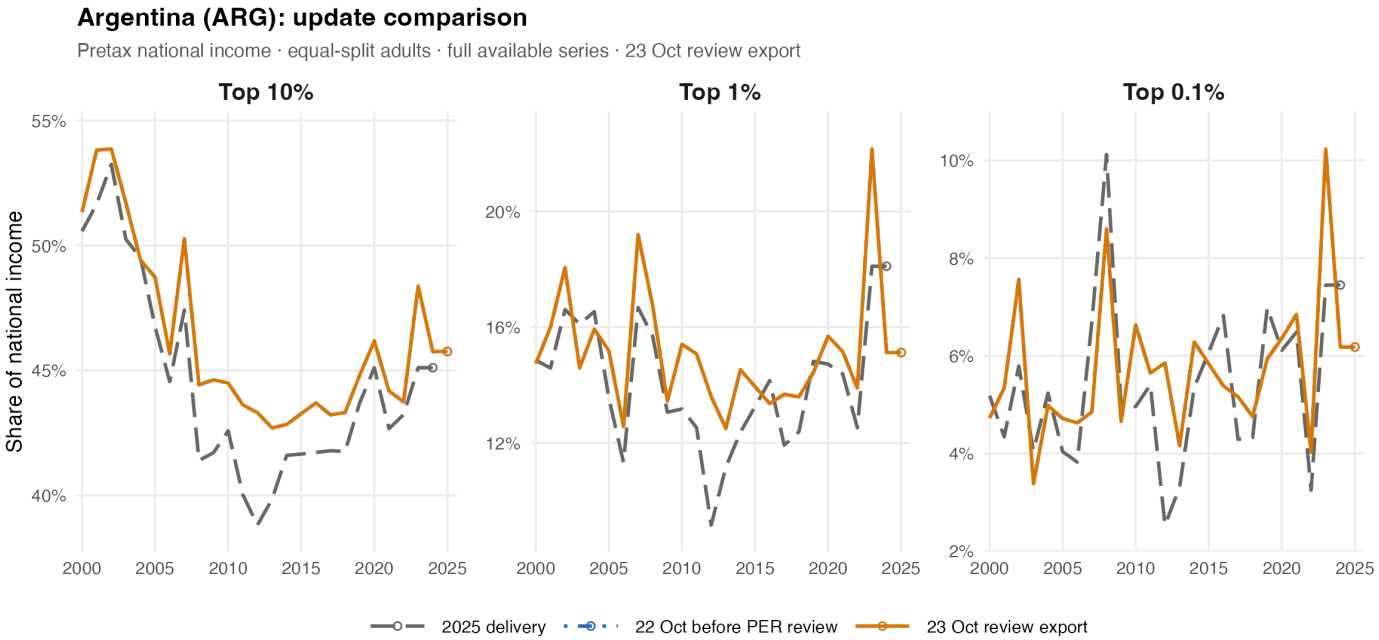

- Outstanding: PER's macro update changes inputs for ARG, CHL, SLV and URY. COL/ECU's accepted 2024 accounts also remain unconsumed. These are named updates, not a reason to restart every stage.

Largest common-year differences from the 2025 delivery

Country	Top 10%: largest gap	Top 1%: largest gap
ARG - Argentina	4.50 pp (2012)	4.45 pp (2012)
BRA - Brazil	0.90 pp (2002)	1.29 pp (2021)
CHL - Chile	0.98 pp (2009)	1.91 pp (2009)
COL - Colombia	2.38 pp (2024)	4.94 pp (2024)
CRI - Costa Rica	3.18 pp (2018)	4.62 pp (2018)
DOM - Dominican Republic	2.95 pp (2024)	3.86 pp (2024)
ECU - Ecuador	12.52 pp (2016)	9.93 pp (2006)
MEX - Mexico	1.35 pp (2024)	0.88 pp (2020)
PER - Peru	2.55 pp (2021)	3.52 pp (2007)
SLV - El Salvador	1.77 pp (2005)	5.29 pp (2000)
URY - Uruguay	1.51 pp (2024)	4.57 pp (2024)

Maximum absolute gaps are descriptive, not causal attributions. Consult each country page and the comparison CSV for signs, years and the latest-review effect.

ARG | Argentina

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest within-series interpolation: 2015.

The median extrapolation for every year from 2000 through 2014 was already used last year. Its correction profile comes from Argentina's own observed Admin-survey matches, not other countries. Real survey revisions and changes in the corrected/imputed distributions explain most of the gap entering final fitting; cross-country macro donors are a separate later mechanism.

What changed

- The 2012 sample expands from 54,589 to 110,850 records; the old sample corresponds to quarter 4.

- The 2007 sample and weights are unchanged, but wage/mixed-income classification and other-income values were revised.

- For 2012, changed inputs explain +3.93 percentage points of the top-1 share; final processing adds +0.53 points in the controlled comparison.

- Across 2000–2022, changed inputs dominate the top-1 difference in 22 of 23 years; 2002 is the exception.

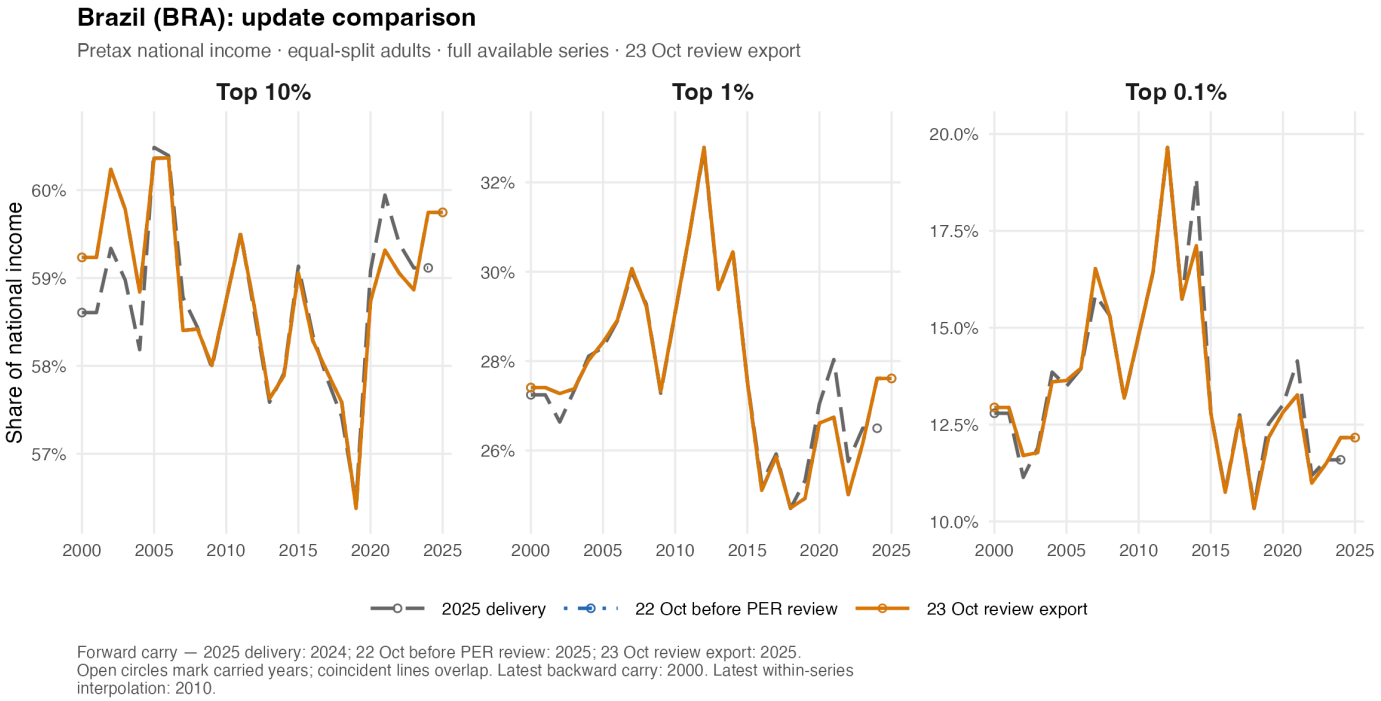

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	0.65 pp	4.50 pp (2012)
Top 1% vs 2025	2024	-2.98 pp	4.45 pp (2012)

Interpretation / remaining uncertainty

The input/code decomposition is controlled; it is not a full raw-survey/macro attribution. Historical correction-state and macro reconstruction leave an explicitly unallocated remainder.

Evidence: country-evidence.json, entry ARG; underlying sources and diagnostic comparisons are listed there.

BRA | Brazil

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest backward carry: 2000. Latest within-series interpolation: 2010.

New survey and administrative observations extend coverage to 2024. The local Admin interpolation and effective-rate generation are now executable, including publisher layout and unit changes through 2024. The accepted country-SNA workbook still ends in 2021, so later macro composition is not a new Brazilian country-SNA observation.

What changed

- Admin source review adds 2024; current observed-theta panel includes 2024 at 92%.
- Survey provider weights change in 2016–2023 even though record counts do not.
- Country-SNA review has 904 unchanged extracted values over 2000–2021; no new 2022–2024 direct CEI values.
- 04a 0 builds rate points from publisher tables through 2024; 02d 5 produces local GPinter Admin output.

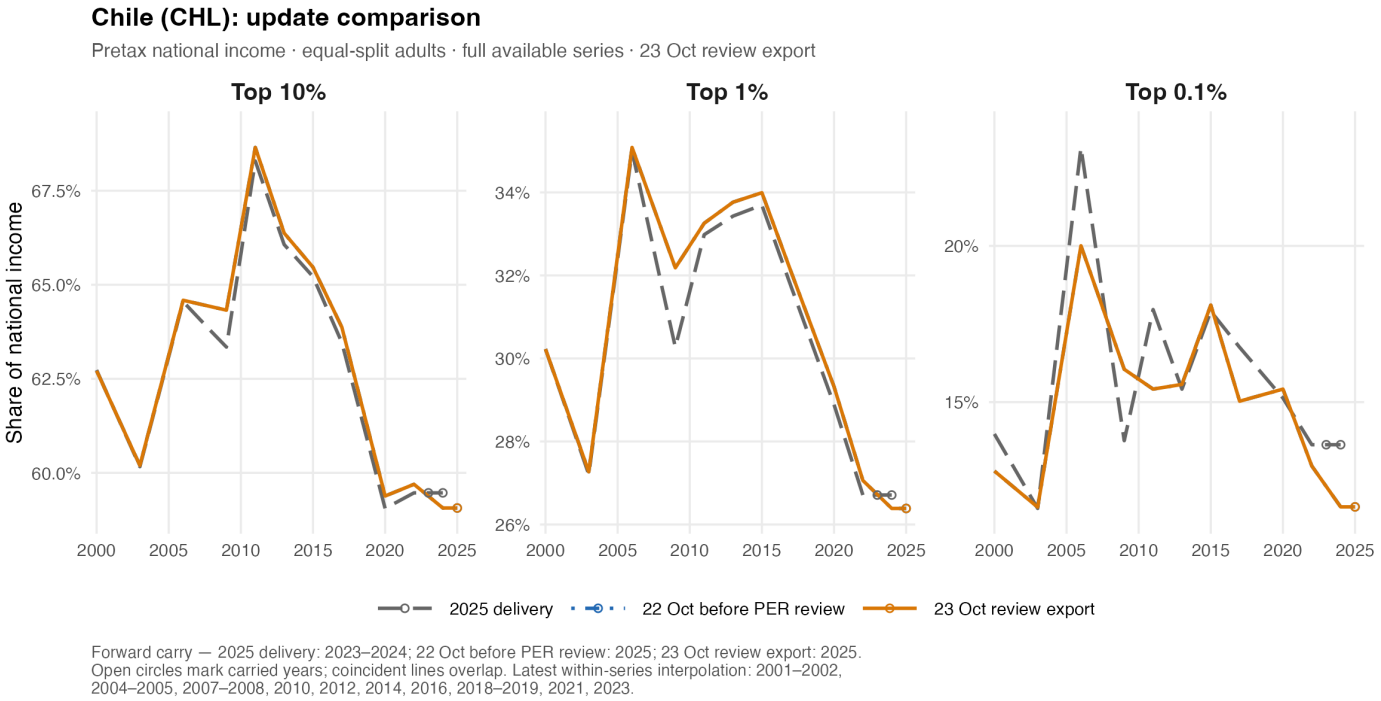

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	0.63 pp	0.90 pp (2002)
Top 1% vs 2025	2024	1.11 pp	1.29 pp (2021)

Interpretation / remaining uncertainty

No complete BRA numerical attribution has been run. Local Admin interpolation differences are recorded separately; do not call all differences merely storage precision.

Evidence: country-evidence.json, entry BRA; underlying sources and diagnostic comparisons are listed there.

CHL | Chile

Forward carry — 2025 delivery: 2023–2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025. Open circles mark carried years; coincident lines overlap. Latest within-series interpolation: 2001–2002, 2004–2005, 2007–2008, 2010, 2012, 2014, 2016, 2018–2019, 2021, 2023.

The update adds a 2024 survey and 2023–2024 administrative tables. Accepted national-account inputs also extend to 2024 and revise historical values. These direct input changes coexist with changed donor-dependent income imputation and the common final-fitting changes.

What changed

- Observed correction includes 2024 at 91%.

- Accepted Admin coverage extends 2005–2022 to 2005–2024; the survey remains periodic rather than annual.

- Country-SNA review identifies 362 revised extracted values and 88 additions, extending 2003–2022 to 2003–2024.

- Chile 2012 is excluded from posttax Admin interpolation for a threshold/mean conflict but retained in pretax interpolation for rates.

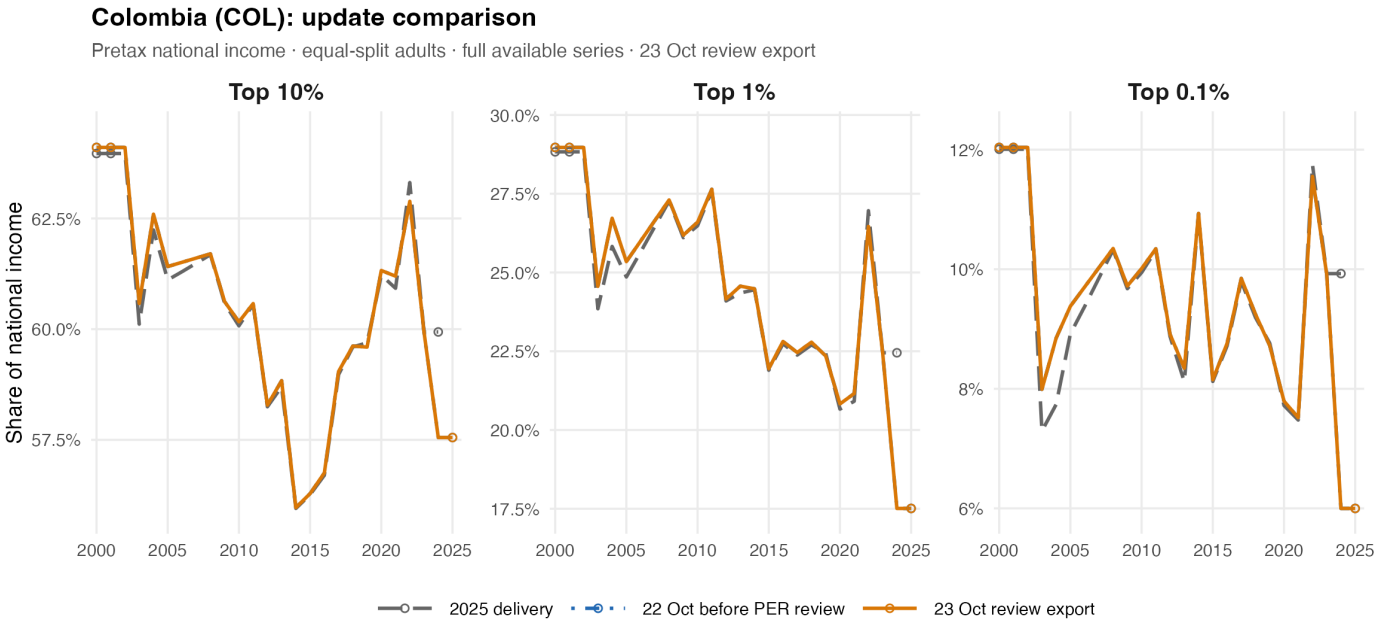

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	-0.40 pp	0.98 pp (2009)
Top 1% vs 2025	2024	-0.32 pp	1.91 pp (2009)

Interpretation / remaining uncertainty

No controlled decomposition separates Chile survey, Admin, macro and final-fitting effects. Historical survey byte changes alone do not prove income revisions.

Evidence: country-evidence.json, entry CHL; underlying sources and diagnostic comparisons are listed there.

COL | Colombia

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest backward carry: 2000–2001. Latest within-series interpolation: 2006–2007.

The new 2024 survey is combined with Admin evidence through 2023, so 2024 remains an extrapolated correction. The 2021 observed merging point is 93%. A new handoff audit finds that accepted 2024 national-account tables are present but 01b still consumes the 2023 release; this must be distinguished from a completed 2024 macro update.

What changed

- Accepted Admin extension is 2023, not 2024.

- Current observed panel contains 2014–2023;2021 merging point 93%; no 2024 observed row.

- Accepted national-account review has 86 revised extracted values and 49 additions.

- Old consumed COL workbook has 2014–2023 sheets only; accepted new workbook adds 2024; prepared 2024 CEI fields are missing.

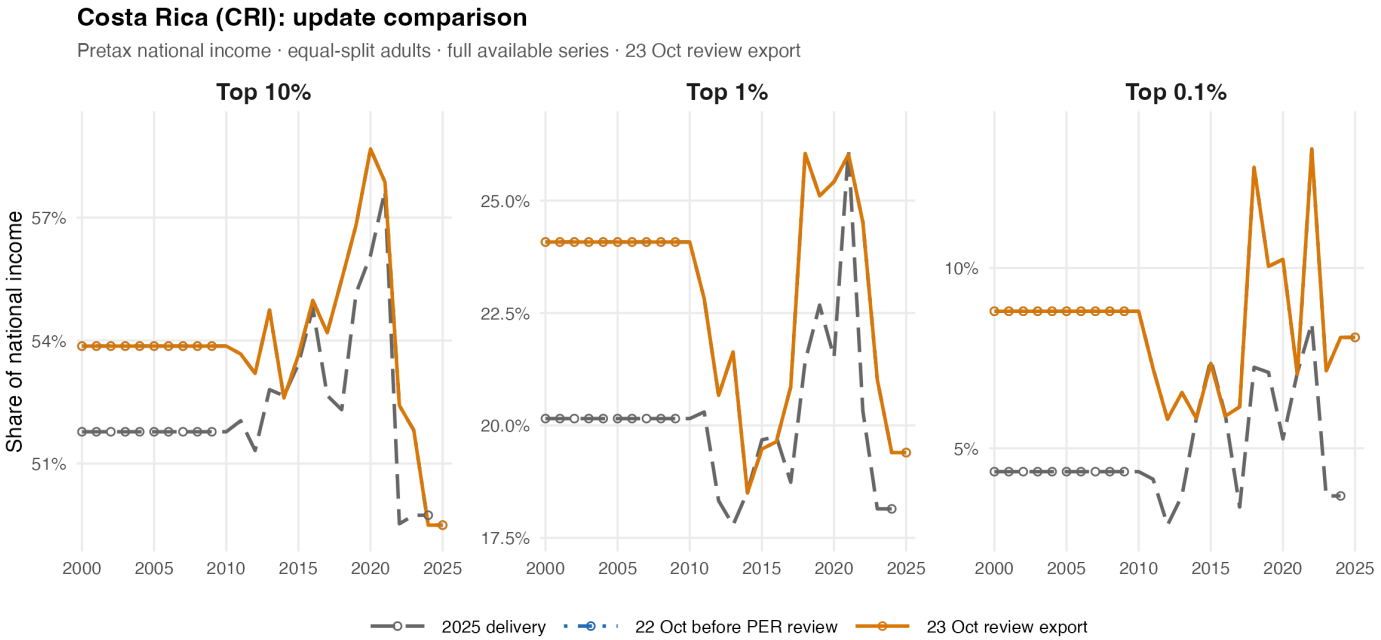

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	-2.38 pp	2.38 pp (2024)
Top 1% vs 2025	2024	-4.94 pp	4.94 pp (2024)

Interpretation / remaining uncertainty

Confirmed source-to-pipeline handoff omission: do not describe the accepted 2024 SNA file as consumed. The handoff repair and its downstream refresh remain pending; this review still uses the older accounts.

Evidence: country-evidence.json, entry COL; underlying sources and diagnostic comparisons are listed there.

CRI | Costa Rica

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest backward carry: 2000–2009.

The 2024 survey extends the internal series, while the consumed 2012–2021 country-SNA workbooks have not changed. Independent observed donors now make the approved 2010–2016 extrapolated replacements reproducible. The final tail-processing correction, including the previously ineffective top-0.01% country rule, explains why unchanged Admin years do not guarantee unchanged published shares.

What changed

- Observed donor years 2010–2016 retained; their approved extrapolated replacements remain. Backward 2000–2009 still uses the 2010 distribution.

- Ten consumed 2012–2021 SNA workbooks unchanged; review records 480 unchanged extracted values.

- Existing top 0.1/top 0.01 multipliers 2.18/7.23 retained with 2016/2021 exceptions; cRI→CRI activates intended top 0.01 rule.

- Current final-fitting route preserves retained income anchors instead of the legacy cleaner clipping bracket means.

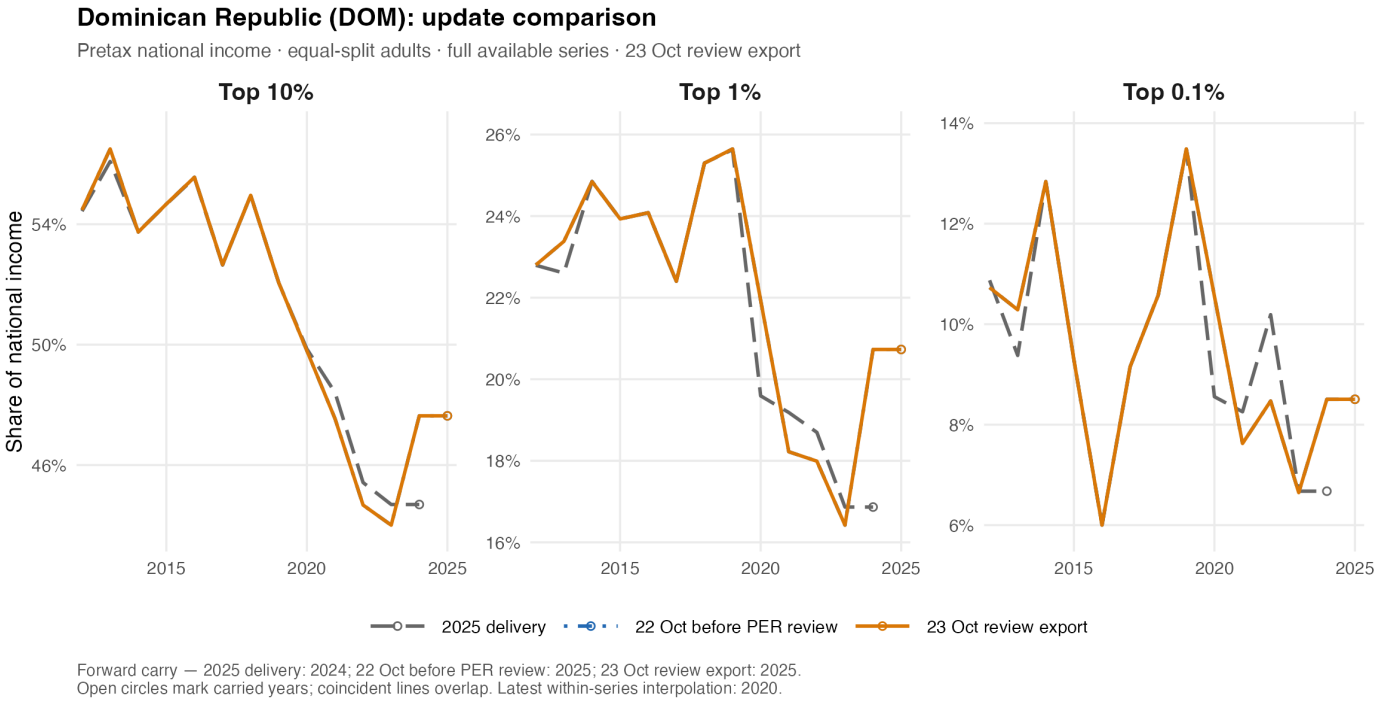

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	-0.24 pp	3.18 pp (2018)
Top 1% vs 2025	2024	1.25 pp	4.62 pp (2018)

Interpretation / remaining uncertainty

Dated correction-review figures are correction-stage diagnostics, not final national-income exports. Full numerical attribution belongs to the separate CRI diagnostic; WID revisions and generic fitting changes should not be conflated with new country-SNA inputs.

Evidence: country-evidence.json, entry CRI; underlying sources and diagnostic comparisons are listed there.

DOM | Dominican Republic

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest within-series interpolation: 2020.

The survey gains 2024, but no new Admin year was supplied. A missing historical national-account workbook had distorted the prepared capital composition; restoring it corrects that calculation and affects some other countries through donor-based imputation. DOM 2020 remains excluded from observed correction cases.

What changed

- Historical input_data/sna_country_data/DOM/cei.xlsx restored byte-for-byte fromDOM/old/cei.xlsx on 21 Oct.

- Restored 2014–2016 composition lowers later capital multiplier 42.8155→25.5022; historical comparator 25.6783.

- DOM macro repair propagates into 05b inputs for ARG,CHL,SLV,URY; CRI and 05d tax/spending donor inputs unaffected.

- Current observed donor panel covers 2012–2019 and excludes 2020.

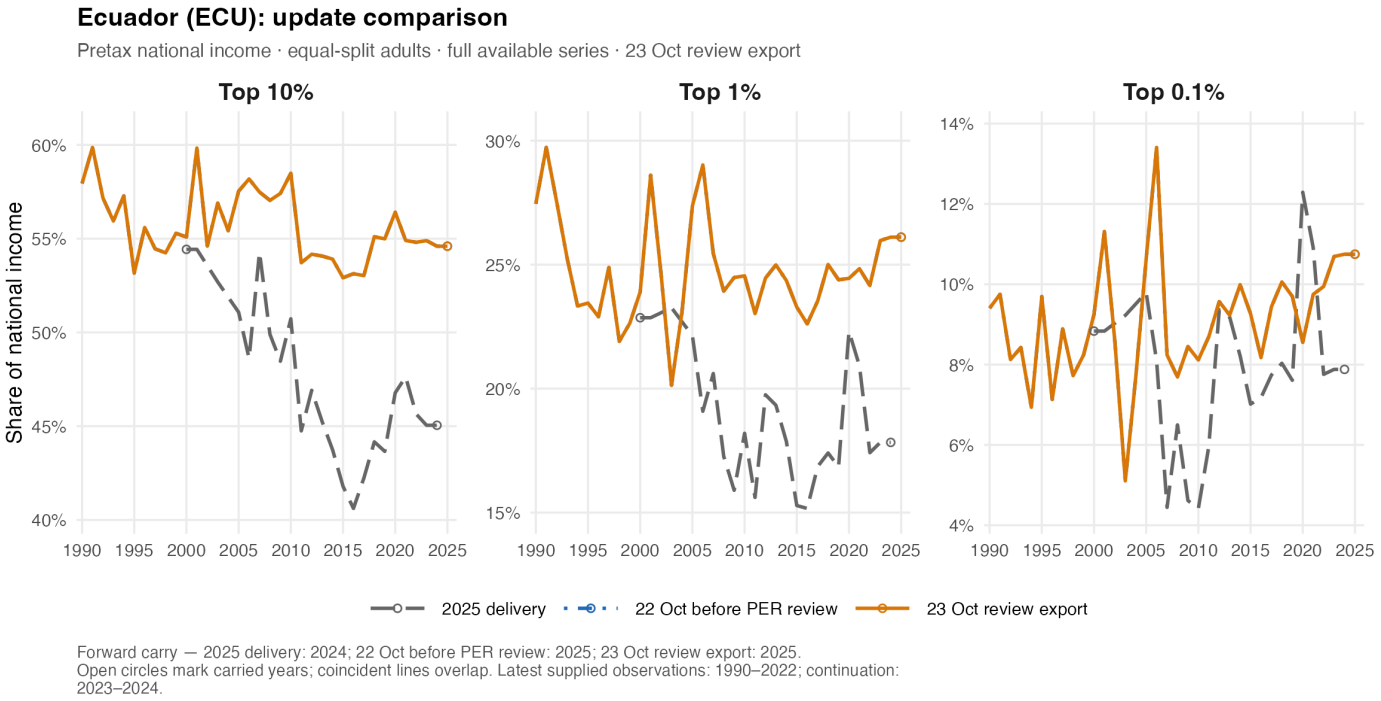

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	2.95 pp	2.95 pp (2024)
Top 1% vs 2025	2024	3.86 pp	3.86 pp (2024)

Interpretation / remaining uncertainty

The late-September SNA exploration predates this repair and shows DOM unavailable. Do not reuse that snapshot as current missing-source status, or attribute the entire final DOM gap to the multiplier alone.

Evidence: country-evidence.json, entry DOM; underlying sources and diagnostic comparisons are listed there.

ECU | Ecuador

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest supplied observations: 1990–2022; continuation: 2023–2024.

Publication now uses the approved researcher distribution for 1990–2022, with a continuation based on internal changes in four broad income groups. The supplied distribution and its continuation use the same WID national-income scaling as other countries. A separate audit finds that the accepted 2024 Ecuador SNA source is not yet consumed by 01b, which matters for internal estimates used in the continuation.

What changed

- Accepted supplied source has 132 distributions over 33 years and publication concept nat/esn; original and prepared files kept separately.

- Approved group join preserves 1990–2022 and uses bottom 50,middle 40,p 90–99,top 1 internal changes from 2022;2025 distribution carries 2024.

- Active candidate is publication-20261022-225245-file 828 c 36 e 559 da; zero internal bins allowed with positive group totals; same WID benchmark.

- Accepted 2024 SNA file hasCEI_2024 p, while consumed 2023 file does not; prepared 2024 CEI fields are missing.

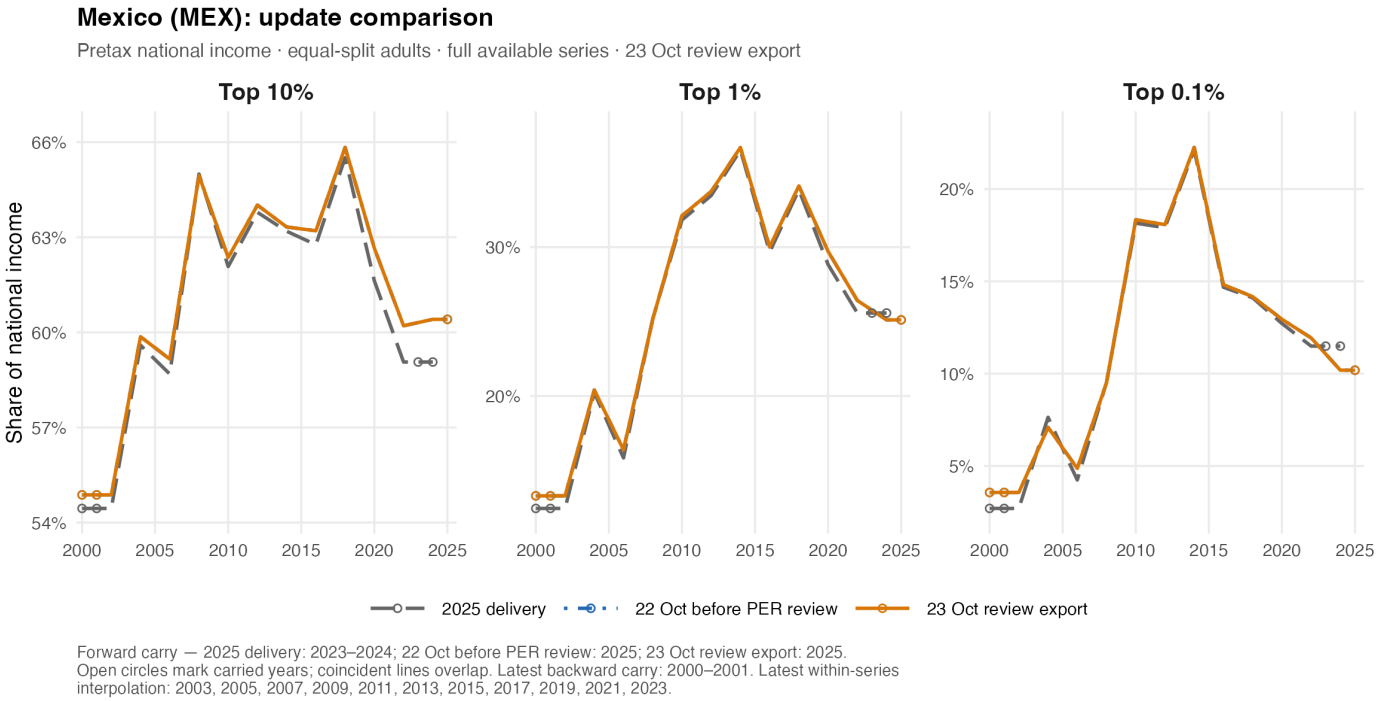

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	9.55 pp	12.52 pp (2016)
Top 1% vs 2025	2024	8.28 pp	9.93 pp (2006)

Interpretation / remaining uncertainty

Original population/currency/price-basis definitions remain undocumented. New accepted source availability does not mean its macro handoff is complete; the continuation may need refreshing after a corrected internal update.

Evidence: country-evidence.json, entry ECU; underlying sources and diagnostic comparisons are listed there.

MEX | Mexico

Forward carry — 2025 delivery: 2023–2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest backward carry: 2000–2001. Latest within-series interpolation: 2003, 2005, 2007, 2009, 2011, 2013, 2015, 2017, 2019, 2021, 2023.

The 2024 survey and country-SNA release extend Mexico coverage. Historical Admin wage distributions were restored as approved external inputs because the original microdata are too large to reproduce here and had not changed. New survey and macro inputs can therefore change final estimates even though the Admin series is reused.

What changed

- Survey coverage is even years 2000–2024; intervening years are not new surveys.

- Accepted country-SNA review extends 2003–2023 to 2003–2024, with 65 revised extracted values and 49 new observations.

- Historical Admin wage inputs retained as approved external sources, not fabricated producer runs.

- Observed donor cases are 2010,2012,2014, matching actual survey/Admin overlap.

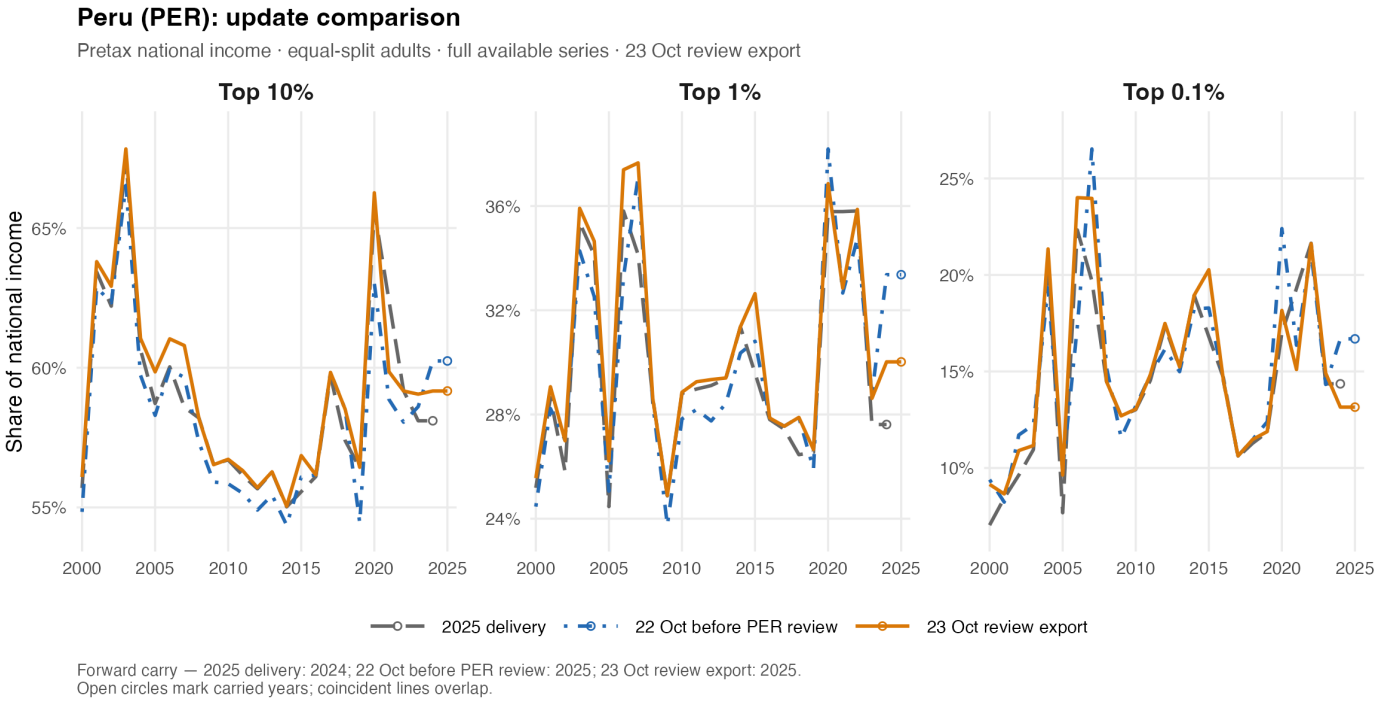

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	1.35 pp	1.35 pp (2024)
Top 1% vs 2025	2024	-0.46 pp	0.88 pp (2020)

Interpretation / remaining uncertainty

No controlled Mexico input/code attribution was run. Reused Admin inputs do not imply every downstream value should equal last year.

Evidence: country-evidence.json, entry MEX; underlying sources and diagnostic comparisons are listed there.

PER | Peru

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap.

Historical 2019–2020 Admin donors have been reinstated and independently recalculated, restoring the previous donor eligibility. The pipeline now reads the accepted 2007–2024 annual national-account inputs instead of its frozen merged workbook. The selected PER calculation has completed through the review export in 07d; the 23 October export is for review and the published 22 October export remains preserved.

What changed

- Observed donor set now 2016–2020; exact 2019/2020 Git Admin sources restored and registered.

- Updated annual national accounts now cover 2007-2024, including historical revisions and the added 2024 year.

- Recomputing PER's correction left other countries' observed correction profiles unchanged.

- Review export: top-10 share is 56.44% in 2019 versus 56.41% in the 2025 delivery; 66.26% in 2020 versus 65.65%. The 2021 estimate is 59.86%, versus the previously interpolated 62.41%.

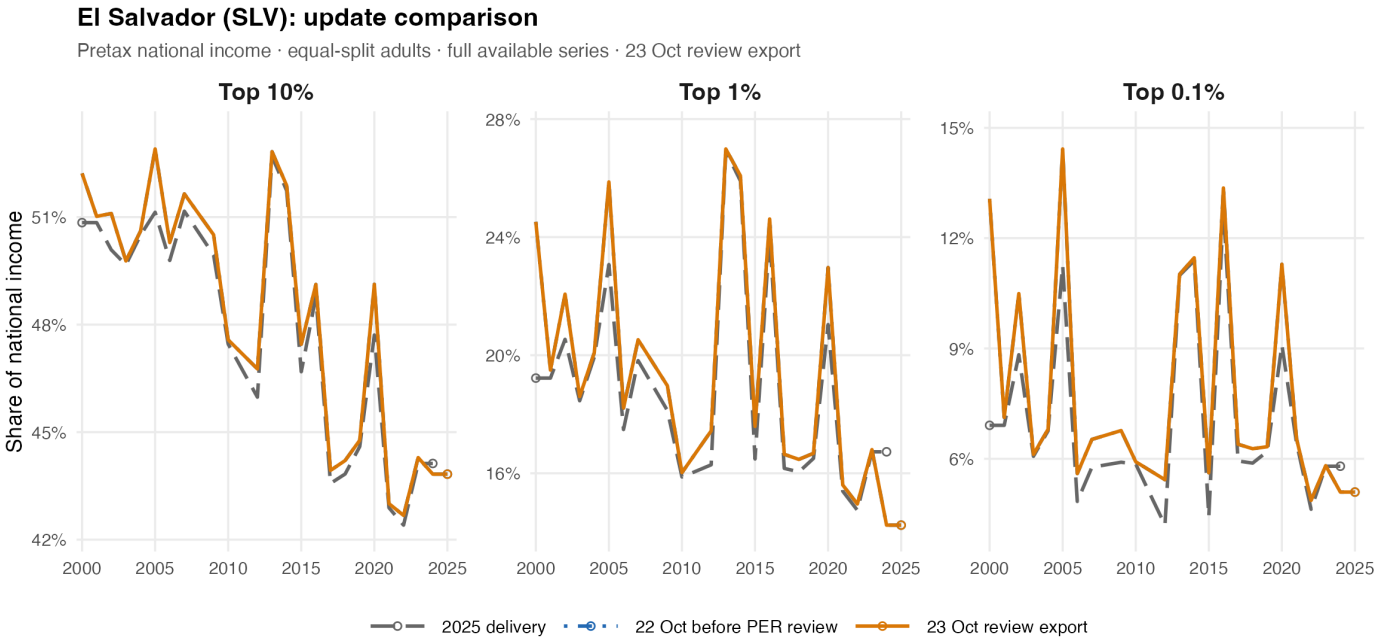

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	-1.08 pp	3.24 pp (2020)
Top 1% vs 22 Oct	2025	-3.35 pp	4.10 pp (2006)
Top 10% vs 2025	2024	1.07 pp	2.55 pp (2021)
Top 1% vs 2025	2024	2.40 pp	3.52 pp (2007)

Interpretation / remaining uncertainty

The 23 October staged export is not an approved final replacement. Donor-dependent refreshes for ARG, CHL, SLV and URY remain pending scope approval; the newly confirmed COL/ECU SNA handoff omissions also prevent declaring the all-country update complete. Treatment of PER 2015/2021 remains a review decision.

Evidence: country-evidence.json, entry PER; underlying sources and diagnostic comparisons are listed there.

SLV | El Salvador

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest within-series interpolation: 2008, 2011.

The survey update adds 2024 while the observed Admin donor series remains historical. The extrapolation repair includes the previously failing 2000 case. Donor-based income imputation also changes when Dominican, Argentine/Costa Rican or Peruvian prepared donor inputs are updated.

What changed

- Observed donor cases 2001–2007,2009–2010,2012–2017; no newly supplied Admin year identified.
- Survey 2008/2011 remain gaps in source coverage, handled by existing interpolation rules.
- No direct country-SNA series covered by the accepted source review; donor dependence is therefore material.
- DOM repair affected 05b donor inputs for SLV; the latest PER donor update identifiesSLV again as a recipient.

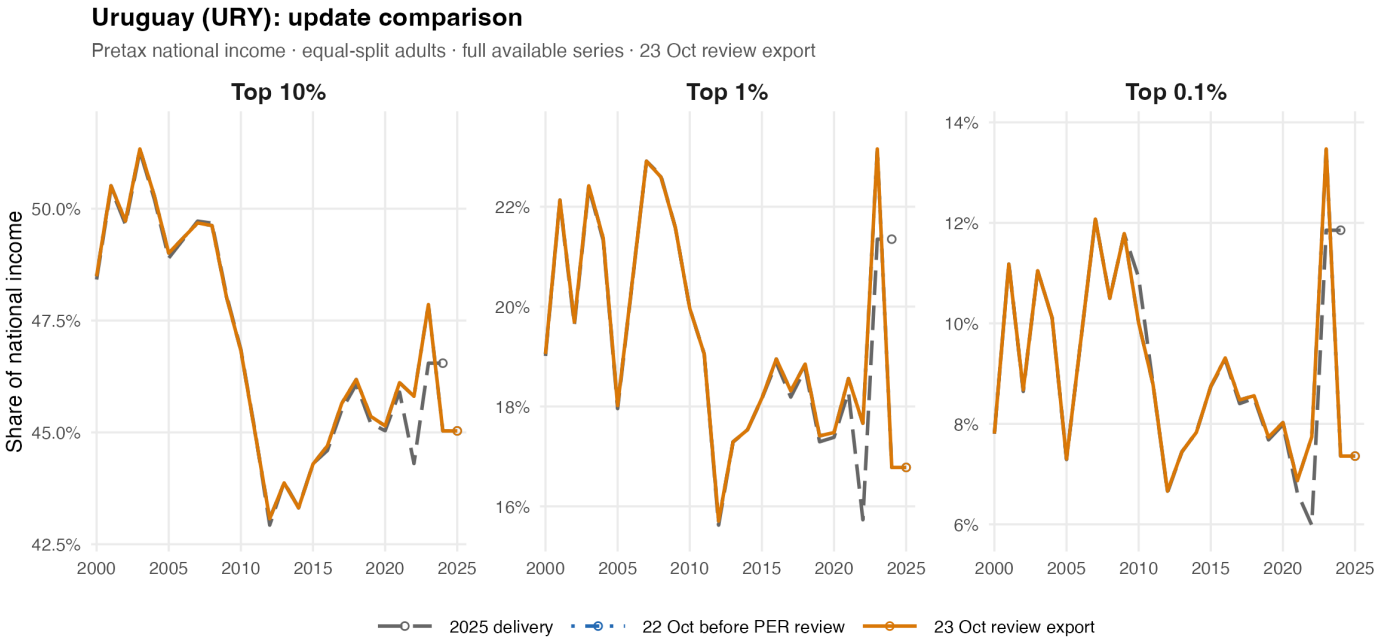

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	-0.30 pp	1.77 pp (2005)
Top 1% vs 2025	2024	-2.48 pp	5.29 pp (2000)

Interpretation / remaining uncertainty

No controlled SLV causal decomposition was run. Successful retry of a failed case is an execution repair, not permission to alter its scientific eligibility.

Evidence: country-evidence.json, entry SLV; underlying sources and diagnostic comparisons are listed there.

URY | Uruguay

Forward carry — 2025 delivery: 2024; 22 Oct before PER review: 2025; 23 Oct review export: 2025.
Open circles mark carried years; coincident lines overlap. Latest within-series interpolation: 2006.

The survey update adds 2024, and accepted country-SNA evidence adds 2022. The historical Admin distributions and effective rates remain external inputs computed from large microdata; no new interpolation is needed. Downstream donor-based imputations can still change despite unchanged Admin inputs.

What changed

- Historical Admin distribution/rate files cover 2009–2016; current observed donor panel uses those years.
- Survey 2006 remains a gap; no additional actual 2006 survey has been created.
- Country-SNA review identifies 16 new values for 2022 alongside 112 unchanged values in its covered concepts.
- DOM repair affected 05b donor inputs for URY; PER donor changes identifyURY as another recipient.

Measure / comparison	Latest common year	Difference	Largest absolute gap
Top 10% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 1% vs 22 Oct	2025	0.00 pp	0.00 pp (unchanged)
Top 10% vs 2025	2024	-1.51 pp	1.51 pp (2024)
Top 1% vs 2025	2024	-4.57 pp	4.57 pp (2024)

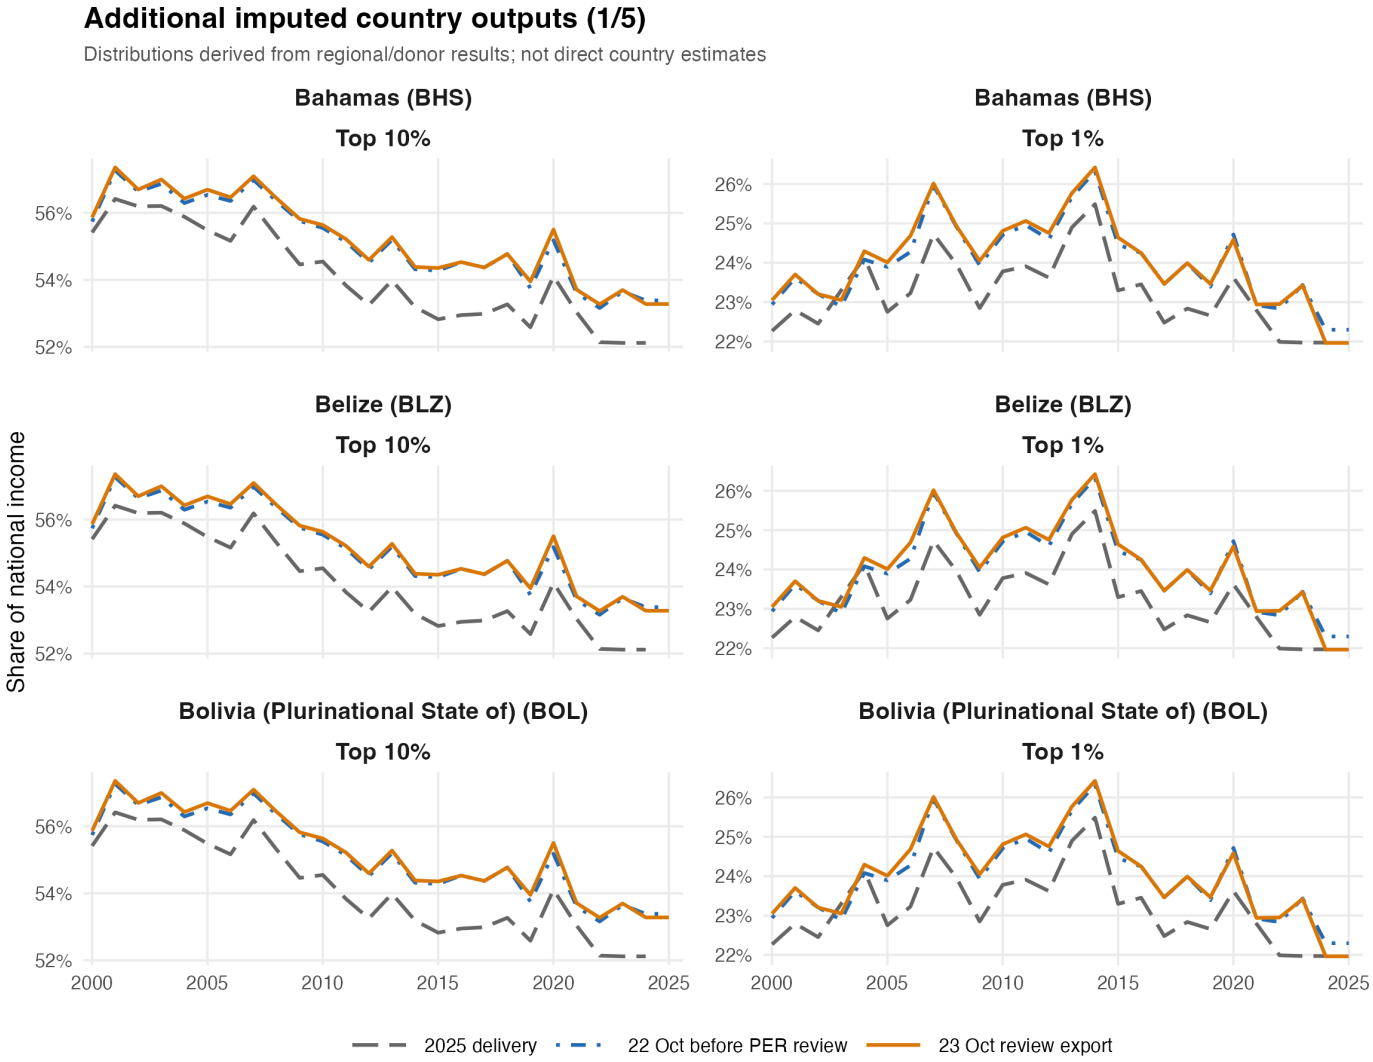

Interpretation / remaining uncertainty

No controlled URY causal decomposition was run. Country-SNA concepts have uneven historical coverage; a first/last-year range must not be mistaken for a complete annual panel.

Evidence: country-evidence.json, entry URY; underlying sources and diagnostic comparisons are listed there.

Donor-imputed countries

These countries do not have independent microdata calculations in this pipeline. Their distributions use regional donor estimates; identical curves across several countries reflect that shared method, not duplicated survey evidence.

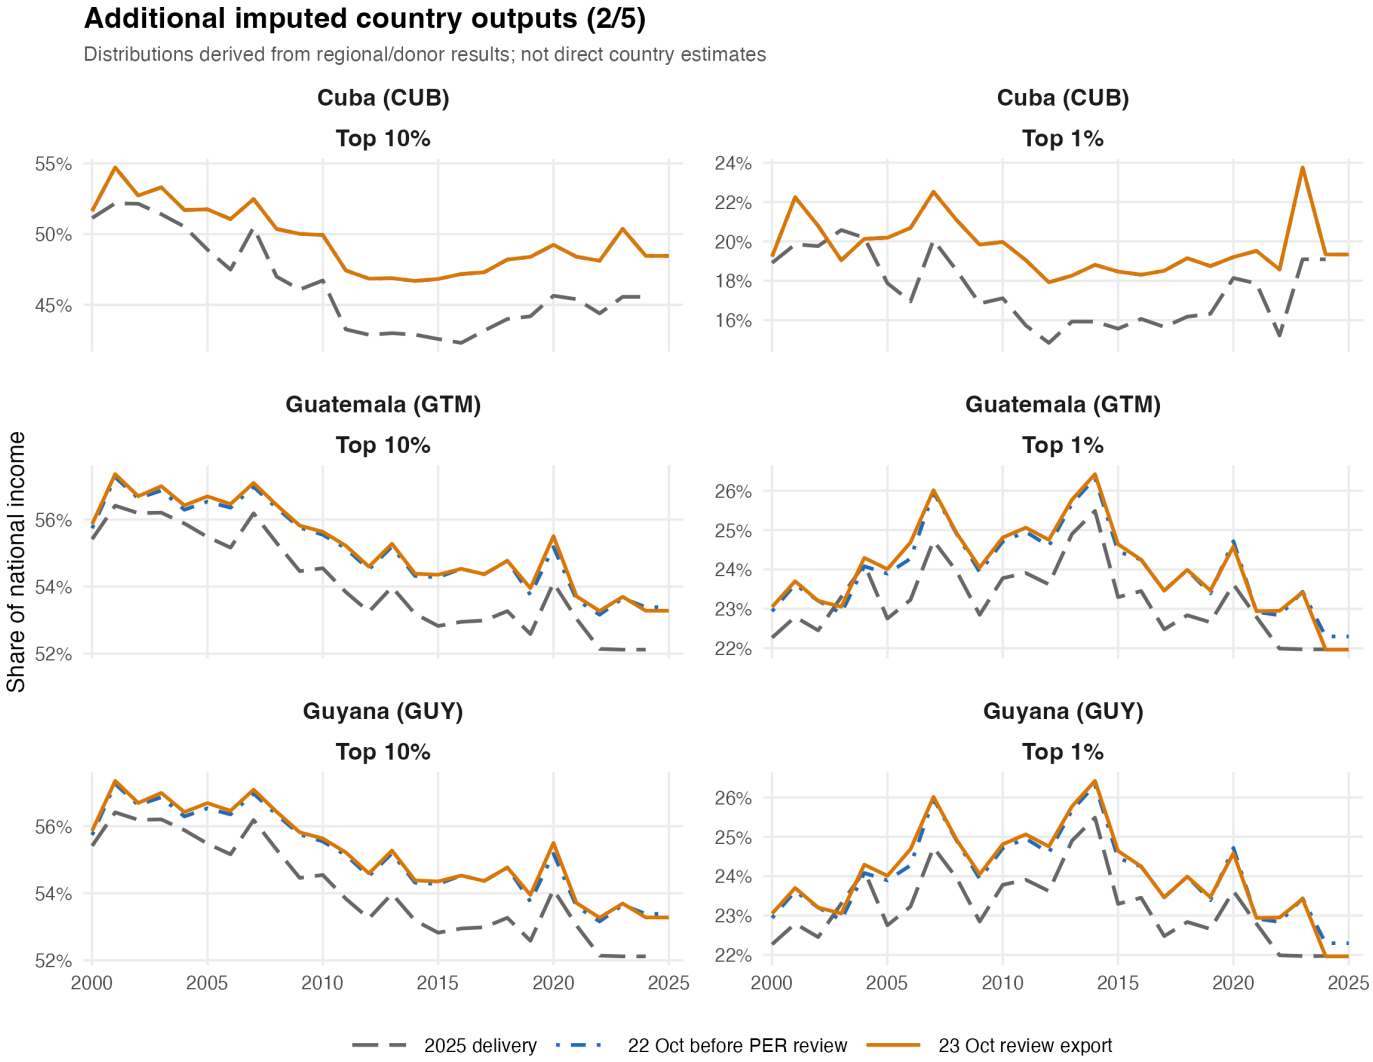

Full exported time coverage. Coincident lines overlap. The 23 Oct export is for review; the published version remains 22 Oct.

The new PER contribution changes the common regional estimate. Cuba follows its separate donor rule and is unchanged by this PER review. Differences from the 2025 delivery combine the broader donor updates described on the preceding country pages. Country-specific maxima and latest-year differences are in imputed-country-summary.csv.

Donor-imputed countries | continued

These countries do not have independent microdata calculations in this pipeline. Their distributions use regional donor estimates; identical curves across several countries reflect that shared method, not duplicated survey evidence.

Source coverage and provenance

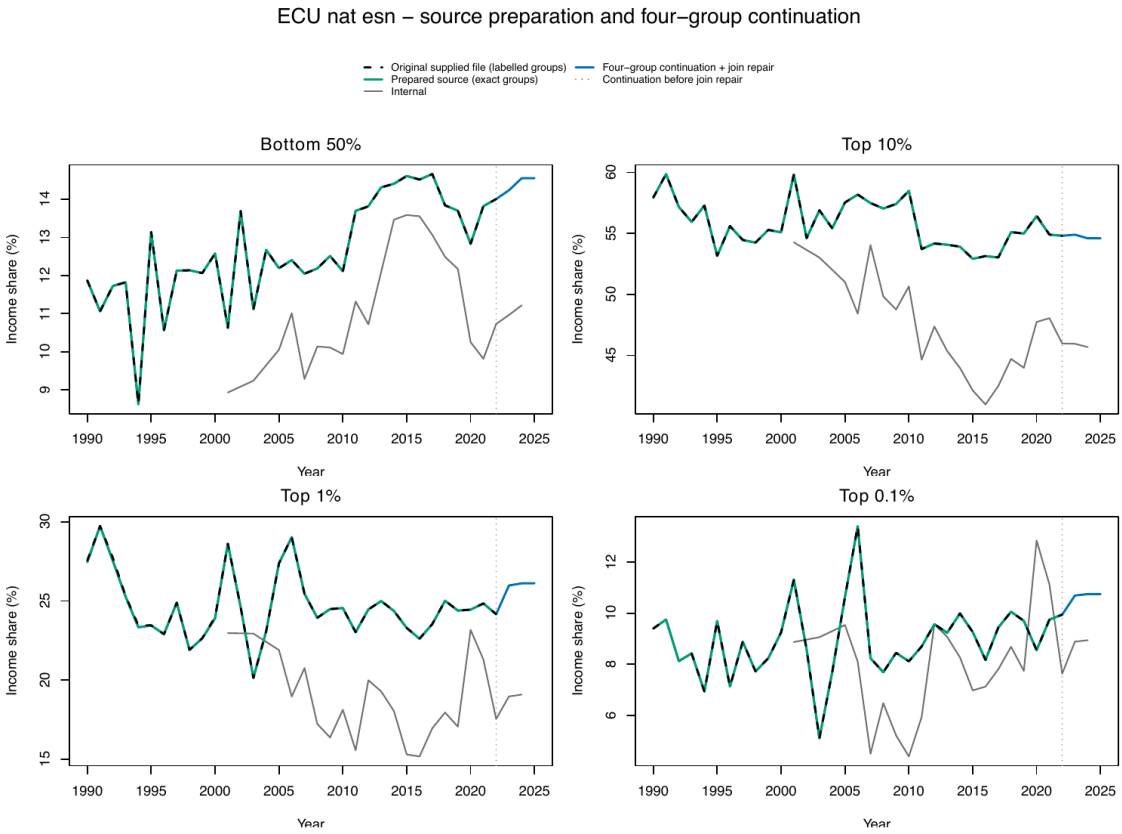

These are recorded source reviews, with their original review dates. They describe available inputs; they are not a live success dashboard. Later restoration or handoff fixes are identified in the country notes.

National-accounts coverage: September source review

28 September exploration snapshot, existing versus incoming sources. It predates DOM restoration and the PER handoff repair. Accepted source coverage does not establish that the current pipeline consumes the file.

Ecuador: supplied distribution and continuation

Groups: p0–50 | p50–90 | p90–99 | p99–100. Vertical line: 2022 join.
Labelled source boundaries may differ from exact population boundaries; preparation differences are on page 2.

Approved source/integration comparison from the existing update figures. Researcher observations end in 2022. Continuation follows internal changes in bottom 50%, middle 40%, p90-p99 and top 1%; the final year is carried forward. This figure predates the pending Ecuador national-accounts handoff repair.

Accepted coverage by source family

Reproducible comparison files

Figures, comparison values, source evidence and this report builder are stored in output/experiments/delivery-report-20261023/. This report reads completed exports and does not recalculate scientific results.

Previous delivery: input_data/_new/previous_series/dina_latam_7Nov2025.dta

Before this review: output/latest_wid_series/dina_latam_22Oct2026.dta

Review export: output/experiments/per-completion-review/export/stage/output/latest_wid_series/dina_latam_23Oct2026.dta

Export checks: output/experiments/per-completion-review/export-validation.log

Country evidence: output/experiments/delivery-report-20261023/country-evidence.json

Complete source coverage: output/experiments/delivery-report-20261023/source-coverage.csv

Interpretation and audit notes

Correction donors versus macro donors

For ARG and CRI, a correction donor is an observed Admin-survey match from that same country and another year. The median rank profile is applied to each recipient year's own survey. Later macro imputations can use other countries when components are unavailable; those cross-country inputs explain why PER changes can affect ARG, CHL, SLV and URY.

What the PER review changes

Historical 2019/2020 Admin workbooks are restored as external inputs. Their observed corrections have been recalculated, then used alongside 2016-2018. The annual 2007-2024 accounts replace the frozen merged source. The previously missing 2015/2021 calculations are included for review; their historical omission has not been established as an intentional scientific exclusion.

What the numerical repairs do

The generic small threshold repair preserves bracket means and population weights. Larger ordered-mean conflicts use GPinter to reconstruct thresholds from retained income/population anchors. Approved tail multipliers remain, and separately approved consolidation/feasibility adjustments are recorded. This is not a calibration to last year's shares.

Country coverage and extrapolation

Calculated years can still use extrapolated BFM corrections; they are not necessarily observed Admin years. Admin in the coverage table means the current observed-donor panel. SNA is accepted source coverage with at least one reviewed numeric concept, not a complete annual concept panel. Asterisks mark COL/ECU sources whose 2024 handoff remains pending. Full exact-year records are in source-coverage.csv.

WID benchmark and supplied-series attribution

WID national-income means and population benchmarks are used in the common harmonization. Uniform monetary scaling alone does not change income shares. WID monetary means currently end in 2024; 2025 normalized distributions are carried forward without inventing a 2025 monetary benchmark. Ecuador 1990-2022 is attributed to Nabernegg, M. (2026), Extreme Income Inequality in Ecuador-Dollarization, Commodity Price Boom, and Citizen Revolution; continuation and processing have separate attribution.

Comparison limits

Differences are reported for every overlapping calendar year, including carried years; origins are included in the CSV. Large gaps do not by themselves prove a method or source error. Detailed ARG controls separate grouped-input changes from final fitting, but do not assign the full gap to raw surveys. Bottom-50/middle-40 comparisons are not used here because a legacy aggregate-label boundary issue remains outside this review.

Execution and publication status

The PER resume reused completed 05b-07b work. Its 07c stop was a Stata R-bridge history-file collision, fixed by explicit Rscript execution with error propagation and UTF-8 handling. All selected fits passed validation. Automatic approval review rejected replacing the full shared publication with the known COL/ECU omissions; the safer 07d review writes only to its own folder and verified the existing publications were unchanged.

Remaining decisions

Review the PER series including 2015/2021. Refresh the four countries affected by changed PER macro donors, then repair COL/ECU source handoffs and recompute the genuinely affected results and ECU continuation. Recheck donor effects at that boundary. No country was silently added to the current computation scope.
